

CV Tin Trung Duong

Chief Technical Officer

Tintd93@gmail.com
+4740603883

My name is Tin Trung Duong, and I have spent the past several years working across different roles in software development and technical leadership. I started my career in early-stage startups, where I learned how to build products from the ground up and contribute across many areas, from coding and infrastructure to project management and customer collaboration. Over time, I have had the chance to work in both private companies and public sector projects, which gave me a broad perspective on how technology can support different kinds of organizations.

What motivates me is the opportunity to keep learning, to work closely with others, and to build technology that is both useful and sustainable.

Key qualifications

- Management and mentorship
- Ruby on Rails, React SQL, .NET,
- AWS, Heroku, Azure
- Code architecture and design.
- Scrum, Shap-up and OKR.

Occupational overview

Costtracker AS	CTO	2024-D.D
Above Steria AS	Senior Software Engineer	2023-2024
Brevio AS	Senior Developer	2021-2023
Arvato Finance AS	Developer	2020-2021
Luca Labs AS	Senior Developer/Developer	2017-2020

Work Details

Place of work: Costtracker
Role: Chief technical officer(CTO)

Currently, I'm leading the technical side of Costtracker, where we are building a Procurement system with additional functionalities such as budget and cashflow.

My role is both strategic and hands-on. I've written code, integrated AI capabilities, established development standards and guidelines, set up infrastructure, and designed technical architecture that can scale as the company grows. I work closely with founders and product teams to translate business needs into technical solutions, while also recruiting and mentoring the first engineers to establish a strong engineering culture. I introduced CI/CD pipelines, testing practices, and agile methods to ensure reliable delivery, while moving many parts of our stack to more cost-efficient and secure cloud services. I manage vendor and tool selection to balance speed, cost, and scalability. A key part of my contribution was leading the transition from an outsourced development setup to a fully in-house engineering team, while ensuring that security and compliance are built into the product, giving the company long-term technical ownership and stability.

This shift has stabilized the product and enabled us to deliver new key features, which supported a steady stream of customers, including public traded ones, contributing to over a 25% revenue increase.

Tools: Ruby on Rails, React.js, AWS, Heroku, Gemini, Lucidtech, PostgreSQL, Appsignal, Scrum, Shape-up, CSS/HTML/Javascript, Figma, Github and Gitlab

Location: Sopra Steria, Agency for Urban Environment (Bymiljøetaten), City of Oslo
Role: Tech lead

At the Agency for Urban Environment in Oslo, I led the technical direction for a new ERP system supporting private contractors in road maintenance and infrastructure projects. I worked with a team of four developers and a product owner, defining code architecture, mentoring developers, and ensuring consistent, high-quality delivery.

I collaborated with stakeholders to plan and prioritize work using the OKR framework, aligning technical execution with business goals. Beyond the project, I worked with agency architects to establish shared standards, including a unified design system and standardized AWS infrastructure across teams.

Tools: .NET Framework, .NET Core, ASP.NET, Amazon Web Services (AWS), GitHub, React.js, React Native, Next.js, PostgreSQL, Objectives and Key Results (OKR), Unit Test, Entity Framework, C#, HashiCorp Terraform, TypeScript

Location: Sopra Steria, Norwegian Directorate of Immigration (UDI)
Role: Senior Developer

At the Norwegian Directorate of Immigration (UDI), I worked as a senior backend developer on internal ERP systems for visa and residence permit processing. I integrated the National Population Register, maintained ID generation services, and delivered new features alongside bug fixes.

I also implemented centralized logging with Elasticsearch and Kibana, contributed to Azure migration, and helped modernize the codebase through refactoring, upgrades, and improved test coverage.

Tools: C#, Akana, Azure API Management, ASP.NET MVC, XML/XSLT, Microservices, Azure DevOps, Oracle Database, Microsoft .NET, Testautomatisering, .NET Core, SOAP, Git, SQL, SoapUI, Testplanlegging, Kibana, Microsoft Team Foundation Server (TFS), Microsoft Azure, Entity Framework, Elasticsearch, Serilog

Location: Brevio
Role: Senior Developer

Brevio is a fintech startup that provides a web-based platform for streamlining administrative processes in the auditing industry. Established in 2016, the company is now a key technology partner for some of the largest auditing firms in Norway.

As a senior full-stack developer, I was responsible for maintaining and building new features for Brevio's core products. These included Brevio Confirm, a tool that allows auditors to collect information from banks, suppliers, clients, and legal firms on behalf of their corporate customers, and Brevio Sign, a digital signing platform primarily used by auditors.

I worked across the company's entire microservice architecture and played a major role in launching new product features. During my time there, I helped significantly reduce server-side errors and increased test coverage by more than 20%. I also collaborated closely with the CTO, sharing responsibility for the backend systems and contributing to the design and implementation of much of Brevio's core architecture and functionality.

Tools: Ruby on Rails, React.js, Redis, GitHub, Atlassian Bitbucket, Heroku, HTML, CSS, PostgreSQL, Amazon Web Services (AWS), AWS Database, Google Cloud Platform, Google Storage, Scrum, PostgreSQL, SQL, Ruby, SOAP, RESTful Web Services, Figma

Location: Arvato Finance
Role: Full-stack developer

At Arvato Financial Solutions, I worked as a full-stack developer on modernizing the legacy core system and transitioning it to a microservice-based architecture. I focused on the invoicing component but contributed across backend systems, developing a new invoice service in .NET and mentoring new developers.

Later, I functioned and was offered the tech lead role, helping define code and error handling standards with senior architects. I introduced a new test architecture and integration testing framework, improved system reliability, and co-designed the onboarding program with the product owner.

Tools: .NET Core, C#, Microsoft SQL Server, Octopus Deploy, TeamCity, React.js, HTML, CSS, Node.js, Azure Kubernetes Service (AKS), GitHub, Scrum, T-SQL, PowerShell, Azure DevOps, Mediator pattern, RESTful Web Services, Entity Framework, RabbitMQ

Location: Luca Labs AS
Role: Senior Developer and Project Manager

At Luca Labs, a fintech startup serving over 10,000 corporate customers in partnership with major Nordic banks, I joined the company at an early stage, and we developed a web-based accounting system with an integrated travel expense app that used ai, enabling SMEs to handle invoicing, bank reconciliation, tax reporting, payroll registration, and more.

Together with the CTO, I developed all major functionalities in the accounting platform and maintained several applications with consistently high-test coverage above 90%. The development team grew from two to nine developers over 18 months. While working primarily as a full-stack developer, I also contributed to project management, recruitment, marketing, and support.

Over time, I took on a senior role and gradually assumed responsibilities from the CTO, including developer onboarding and direct collaboration with banking partners on product development. By the time I left, Luca Labs had launched its accounting system with DNB and delivered a major pilot for Nordea

Tools: Ruby on Rails, JavaScript, HTML, CSS, MySQL, Java, Heroku, Amazon Web Services (AWS), AWS Database, Vue.js, iOS Utvikling, Android, Flutter, Trailblazer, Stimulus, GitLab, Google Firebase, Google Storage, Scrum, Shape-up, Shell script, Bash, PowerShell, SQL, SSH File Transfer Protocol (SFTP), Ruby, GitLab CI/CD, GitHub, Swift, SOAP, GraphQL, RESTful Web Services, Figma

Education

Norwegian School of Information Technology (NITH) | 08.2013–06.2017 | Bachelor in Programming

Language

Norwegian	Native
English	Fluent
